Poincaré series on GL(n) were first introduced by Bump, the author, and Goldfeld, who studied them in the case n=3 (“Poincaré series and Kloosterman sums for SL(3,z)”, Acta Arithmetica, to appear). In this paper they are studied for arbitrary n.

A theory of Poincaré series is developed for Lobachevsky space of arbitrary dimension. For a general non-uniform lattice a Selberg-Kloosterman zeta function is introduced. It has meromorphic continuation to the plane with poles at the corresponding automorphic spectrum. When the lattice is a unit group of a rational quadratic form, the Selberg-Kloosterman zeta function is computed explicitly ...

Abstract. We show that sums of the \(\mathit{SL}(3,\mathbb{Z})\) long element Kloosterman sum against a smooth weight function have cancelation due to the variation in argument of the Kloosterman sums, when each modulus is at least the square root of the other. Our main tool is Li’s generalization of the Kuznetsov formula on \(\mathit{SL}(3,\mathbb{R})\), which has to date been prohibitively ...

In mathematics, a Kloosterman sum is a particular kind of exponential sum.They are named for the Dutch mathematician Hendrik Kloosterman, who introduced them in 1926 when he adapted the Hardy–Littlewood circle method to tackle a problem involving positive definite diagonal quadratic forms in four as opposed to five or more variables, which [vague] he had dealt with in his dissertation in 1924.

Abstract. We prove nontrivial bounds for general bilinear forms in hyper-Kloosterman sums when the sizes of both variables may be below the range controlled by Fourier-analytic methods (Pólya-Vinogradov range).

On the other hand, we introduce the classical Kloosterman sums K (n, q) which are defined as follows: For any positive integer q > 1 and integer n, K (n , q) = ∑ ′ b = 1 q e (n b + b ¯ q) , where b ¯ denotes the solution of the congruence x · b ≡ 1 mod q , ∑ ′ b = 1 q denotes the summation over all 1 ≤ b ≤ q with (b , q) = 1 and e (x) = e 2 π i x .

From Proposition 3 and Proposition 5 we conclude by the same calculation as in that the long Kloosterman sum Σ 3 in contributes O(R 2+ε P 1/2+ε). Similarly, if P < R 3− ε , the other two Kloosterman contributions Σ 2 a + Σ 2 b are O (R −100), and are otherwise O (R 5+ ε) which follows after a straightforward estimate using Proposition 5 and (6.7).
